

CpSc 4620/6620: Database Management Systems (DBMS) (TEXNH Approach)

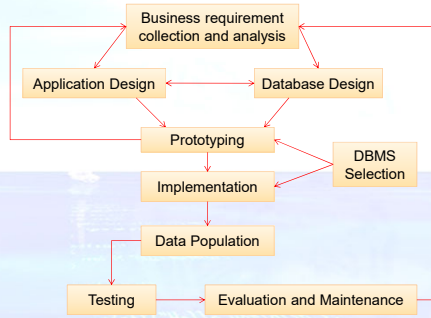

ER Model and Database Design

James Wang

MeTube Project Lifecycle

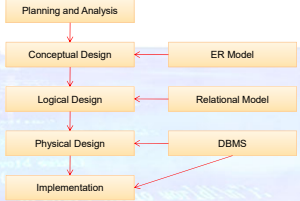

```

graph TD
    A[Business requirement collection and analysis] --> B[Application Design]
    A --> C[Database Design]
    B --> D[Prototyping]
    C --> D
    D --> E[Implementation]
    E --> F[Data Population]
    F --> G[Testing]
    G --> H[Evaluation and Maintenance]
    H --> A
    D --> I[DBMS Selection]
    I --> E
    
```

Database Design

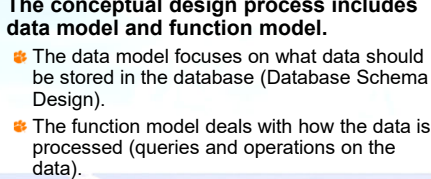

```

graph TD
    A[Planning and Analysis] --> B[Conceptual Design]
    B --> C[Logical Design]
    C --> D[Physical Design]
    D --> E[Implementation]
    B --> F[ER Model]
    C --> G[Relational Model]
    D --> H[DBMS]
    
```

Data and Function Modeling

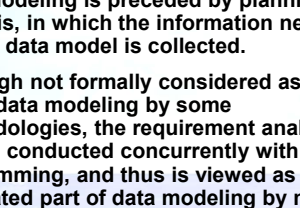

```

graph TD

    B --> A
    
```

Requirement Analysis

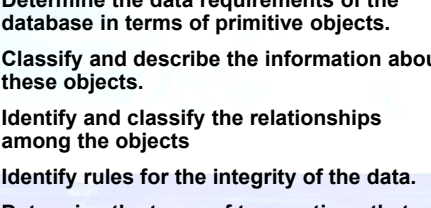

```

graph TD
    A[Requirement Analysis] --> B[Data Modeling]
    B --> A
    
```

Goals of Requirement Analysis

```

graph TD
    A[Goals of Requirement Analysis] --> B[Data Modeling]
    B --> A
    
```

Requirement Collection

- review of existing documents:** Please read the project description.
- interviews with end users:** Discuss with the instructor or your peers about the MeTube system.
- review of existing systems:** Review the YouTube system.
- Note:**
 - End users don't know entities, attributes, and relationships; they know real-world terms.
 - Be sure understand the real-world needs.
 - Different end-users may think about and view data differently.

7

Construction of Data Model

ER model construction:

```

graph TD
    A[Identification of data objects and relationships] --> B[Draft ER Diagram]
    B --> C[Model validation through normalization]
    C --> D[Add business and integrity rules to the model]
    A --> E[Initial ER Diagram]
    E --> F[Refine ER diagram]
    F --> G[Add Key Attributes]
    G --> H[Add Non-key Attributes]
    H --> I[Generalization Hierarchies]
  
```

8

Entity-Relationship Model

- History:**
 - P.P. Chen. *The entity-relational model: Toward a unified view of data*. ACM Transactions on Database Systems, 1(1):9–36, 1976.
- What is ER model?**
 - The ER model is a conceptual data model that views the real world as entities and relationships.
- Why ER model?**
 - Easy to convert to relational model.
 - Easy to learn.

9

ER Model Basics

- Entity: Data object or recognizable concept.**
 - Strong or weak (independent or dependent).
 - Instance: An occurrence of an entity.
 - Special types: associative or subtype.
- Relationship: Association between entities.**
 - Degree (binary, ternary, ..., n-ary).
 - Connectivity and cardinality: 1:1, 1:N, M:N.
 - Direction, Type, etc.
 - Existence: optional or mandatory.
- Attributes: describe the entity of which they are associated.**
- Generalization Hierarchies.**

10

ER Diagram Notation

- Strong Entity:** 
- Weak Entity:** 
- Attribute:** 
- Multi-value attribute:** 
- Composite attribute :** 
- Derived attribute:** 
- Key attribute:** 
- Partial Key:** 

11

ER Diagram Notation (cont.)

- Relationships:** 
- Identifying Relationships: Relationship connecting at least one weak entity.** 
- N-ary relationship: Relationship associated with more than two entities.** 

12

ER Diagram Notation (cont.)

Constraints – Participation:

- Total Participation:** Entity X has total participation in Relationship Z, meaning that every instance of X takes part in **AT LEAST** one relationship. (i.e. there are no members of X that do not participate in the relationship).
- Partial Participation:** Entity Y has partial participation in Relationship Z, meaning that only some instances of Y take part in the relationship.
- Example:** X = Customer, Y = Product, Z = Purchase.

The diagram shows an entity X connected to a relationship Z, which is then connected to entity Y. An arrow labeled 'total' points to the line between X and Z. Another arrow labeled 'partial' points to the line between Z and Y.

ER Diagram Notation (cont.)

Constraints – Cardinality:

The four diagrams show the following cardinalities:

- Customer (1) to Purchase to Product (N)
- Customer (N) to Purchase to Product (1)
- Customer (1) to Purchase to Product (1)
- Customer (M) to Purchase to Product (N)

M:N or 1:N?

The top diagram shows a simple M:N relationship between 'Person' and 'Bank' labeled 'Loan'. An arrow points down to a more detailed diagram where 'Person' is connected to an identifying relationship 'Borrowed By' (1 to M), which is connected to a 'Loan' entity (M to N), which is then connected to another identifying relationship 'Financed By' (N to 1), which is connected to 'Bank' (1).

Question: Is M:N relationship necessary?

ER Diagram Example

This diagram shows a complex set of entities and relationships. 'Strong A' has attributes 'Attribute name' (key), 'Derived', and 'Multi-value'. It is connected to 'Strong B' via an identifying relationship 'AB' (1 to M) and a non-identifying relationship 'BA' (N to 1). 'Strong B' has attributes 'Non-key', 'Partial Key', and 'Multi-value'. It is connected to 'Strong C' via an identifying relationship 'R-BC' (1 to 1) and a non-identifying relationship 'R attribute' (1 to 1). 'Strong C' has attributes 'Multi-value' and 'Non-key'. 'Weak' is connected to 'Strong A' via an identifying relationship (N to 1). 'SR' is connected to 'Strong B' via a relationship (1 to N).

ER Diagram Example 2

This diagram shows a university database schema. 'DEPARTMENT' (1) is connected to 'EMPLOYEE' (N) via 'DEPT_EMP'. 'EMPLOYEE' (N) is connected to 'PROJECT' (M) via 'PROJ_WORK'. 'EMPLOYEE' (N) is connected to 'EMP_DEP' (N) via 'EMP_DEP'. 'EMPLOYEE' (N) is connected to 'DEPENDENT' (N) via 'DEPENDENT'. 'SUPPLIER' (M) is connected to 'PART' (N) via 'SUPP_PART'. 'PART' (N) is connected to 'PART_STRUCTURE' (N) via 'PART_STRUCTURE'. 'PART' (N) is connected to 'SUPP_PART' (N) via 'SUPP_PART'. 'PART' (N) is connected to 'PART_STRUCTURE' (N) via 'PART_STRUCTURE'.

ER Diagram with (min, max) Cardinality

This diagram is similar to slide 16 but includes (min, max) cardinalities. For example, the relationship 'AB' between 'Strong A' and 'Strong B' has (1,M) on the 'Strong A' side and (0,N) on the 'Strong B' side. The relationship 'BA' has (1,N) on the 'Strong A' side and (0,1) on the 'Strong B' side. The relationship 'R-BC' has (0,1) on the 'Strong C' side and (1,1) on the 'Strong B' side. The relationship 'R attribute' has (0,1) on the 'Strong C' side and (1,1) on the 'Strong B' side. The relationship 'SR' has (0,1) on the 'Strong B' side and (1,1) on the 'Strong A' side.

Extended ER Model

- Extended ER model extends the basic ER model by adding following features:
 - An entity definition is known as a class.
 - A specific occurrence of an entity is an instance of a class.
 - Classes can be formed into superclass/subclass hierarchies using generalization and specialization.
 - The IS-A relationship.
 - Inheritance of attributes.
 - Constraints on subclass membership.
 - Categories are used to represent a union of classes.

19

Extended ER Diagram

- Specialization/Generalization:

- Each subclass inherits all relationships and attributes from the super-class.

20

EER Diagram Notation

- Constraints on Specialization/Generalization:
 - Total Specialization** – Every member of the super-class must belong to at least one subclass.
 - Partial Specialization** – a member of the super-class may not belong to one of the subclasses.
 - Disjoint** – every member of the super-class can belong to at most one of the subclasses.
 - Overlapping** – a member of the super-class can belong to more than one of the subclasses.
 - Multiple Inheritance** – a subclass participates in more than one subclass/super-class relationship, and inherits attributes and relationships from more than one super-class.
 - Union** – a subclass/super-class relationship can have more than one super-class, but the subclass inherits from at most one of the super-classes.

21

ER Diagram Notation (cont.)

- Total or partial specialization:

- Disjoint or overlapping specialization:

22

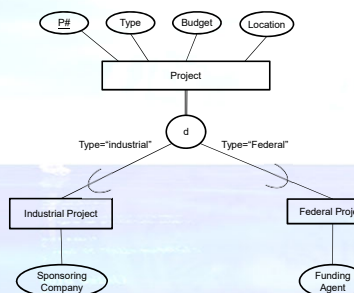

Constraints on Subclass Membership

- The attributes in subclass may be dependent on an attribute value in the superclass:
 - Attribute-defined** - Determines membership in a subclass by placing a condition on the value of an attribute in the superclass.
 - User-defined** - Membership in a subclass does not depend on any specific attribute value. Membership is determined by the user.

23

Attribute-defined Subclass

24

Rules for Attribute-defined Subclass

- If the specialization attribute at the superclass level is single-valued, membership at the subclass level is always disjoint.
- If the specialization attribute at the superclass level is multi-valued, membership at the subclass level is always overlapping.
- If the specialization is total, the attribute value in the superclass is required.
- If the specialization is partial, the specialization attribute value in the superclass is optional. The presence of a value, however, implies automatic insertion at the subclass level.

25

User-defined Subclass

26

Rules for Superclass/Subclass Hierarchy

- Deleting an entity from a superclass implies automatic deletion of the entity from all subclasses.
- Deleting an entity from a subclass does not imply deleting the entity from its superclass. However, attributed-defined constraints must not be violated.
- At the superclass level, changing the value of an attribute used for attribute-defined specialization requires appropriate changes in subclass membership.

27

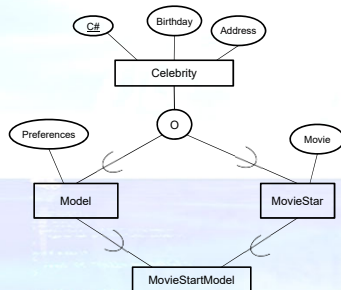

Multiple Inheritance

- A subclass can have more than one superclass. It is called specialization lattice.
- The subclass is referred to as a shared subclass.
- A specialization lattice demonstrates multiple inheritance.
- A shared subclass must satisfy the multiple inheritance intersection constraint, where each instance of the shared subclass is an instance of all of its superclasses.

28

Specification Lattice

$\text{MovieStarModel} = \text{Model} \wedge \text{MovieStar}$

29

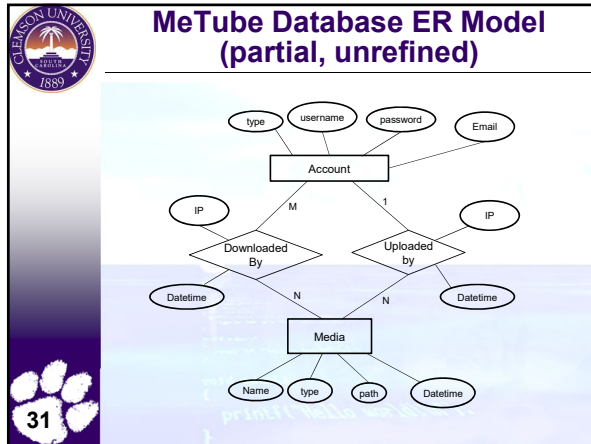

Categories and Categorization

- If a subclass contains instances from two superclass, then this subclass is called a category.
- A category represents a union of its superclasses, where an instance of a category subclass must be an instance of at least one superclass, but is not necessarily a member of all superclasses.
